

REMARKS/ARGUMENTS

Claims 1-44 were originally presented.

Claims 1 and 6-8 are previously presented.

No claims are currently amended

No claims are canceled.

Claims 1, 5-7, 9-11, 16-17, 22-25, 29, 31-33, 37, 39 and 40-44 are rejected under 35 U.S.C. §102(b) as being anticipated by U.S. Patent No. 5,799,168 to Ban (hereinafter "Ban").

Claims 2, 12, 20, 27 and 35 are rejected under 35 U.S.C. §103(a) as being unpatentable over Ban in view of U.S. Patent No. 6,000,006 to Bruce *et al.* (hereinafter "Bruce").

Claims 3-4, 13-14, 19, 21, 26, 28, 34 and 36 are rejected under 35 U.S.C. §103(a) as being unpatentable over Ban in view of U.S. Patent No. 6,493,807 to Martwick (hereinafter "Martwick").

Claims 1-44 remain in this application.

1 **Telephone Conversation with Examiner**

2 Applicant wishes to thank the Examiner for the telephonic conversation on
3 September 13, 2005. Applicant particularly appreciates the Examiner's
4 preliminary indication of the novel and nonobvious nature of a flash driver which
5 supports flash memory devices regardless of the manufacturer of the flash memory
6 devices.

7
8 **35 U.S.C. §102(b)**

9 **Claims 1, 5-7, 9-11, 16-17, 22-25, 29, 31-33, 37, 39, and 40-44**

10 Claims 1, 5-7, 9-11, 16-17, 22-25, 29, 31-33, 37, 39, and 40-44 are rejected
11 under 35 U.S.C. §102(b) as being anticipated by Ban. Applicant respectfully
12 traverses the rejection.

13
14 **Independent claim 1 recites:**

15
16 One or more computer-readable media comprising a flash
17 memory driver that is executable by a computer to interface between
18 a file system and one or more flash memory media, the flash memory
19 driver comprising:

20 flash abstraction logic that is invokable by the file
21 system to manage flash memory operations without regard to the
22 type of the one or more flash memory media; and

23 flash media logic configured to interact with different
24 types of the flash memory media;

25 wherein the flash abstraction logic invokes the flash
 media logic to perform memory operations that are potentially
 performed in different ways depending on the type of the flash
 memory media.

26 Ban fails to disclose the one or more computer-readable media comprising a
27 flash memory driver of claim 1. Rather, as best as Applicant understands Ban, Ban

1 discloses shifting the responsibility for conforming to the particular requirements
2 of a flash chip from a driver installed on a CPU to a controller installed on a flash
3 unit. (Ban, Col. 2, lines 44-46). The CPU sends out commands necessary to
4 perform flash memory tasks in a uniform, standardized format. (Ban Col. 2, lines
5 42-43). The standardized commands (read, write, erase and identify) are received
6 via a command register and are translated by the standardized controller on the
7 flash unit (through a translating apparatus) into commands specific to the type of
8 flash chip on which the controller is installed. (Ban, Col. 3, lines 1-15 and Col. 5,
9 lines 29-33). Thus, when a flash array including multiple flash chips is used,
10 rather than having a single flash driver to communicate with all of the flash chips,
11 several controllers must be used, with a unique controller being placed on each
12 individual flash chip. (Ban, Col. 4, lines 33-35, claim 2 lines 29-30).
13 Consequently, in order for the CPU to communicate with several different types of
14 flash chips, a corresponding number of different controllers must be utilized.

15 Moreover, the possible output from the CPU is limited to standardized
16 signals. (Ban, Col. 2, lines 41-47). Thus multiple file systems having multiple
17 signal types may not be used under Ban.

18 As a result, Ban fails to disclose “flash abstraction logic that is invocable by
19 the file system to manage flash memory operations without regard to the type of
20 the one or more flash memory media” as recited in claim 1. Rather, the
21 responsibility for conforming to the requirements of a particular flash chip is given
22 to a controller installed on the particular flash chip. Thus, the controllers disclosed
23 by Ban are flash chip specific, and cannot be used with other types of flash chips.
24 Therefore, each time a new flash chip is used, a new type of controller that is
25 compatible with the new flash chip must be located on the flash chip. Because of

1 this, the controllers disclosed in Ban are ill-equipped “to interact with different
2 types of the flash memory media” as recited in claim 1.

3 Ban also fails to disclose “flash media logic configured to interact with
4 different types of the flash memory media”. As noted above, the controllers
5 disclosed in Ban are flash chip specific. Thus no one controller could interact with
6 several different types of flash chips. Under Ban, such functionality could only be
7 attained by employing a plurality of different controllers – with each flash chip
8 requiring its own distinct type of controller.

9 In addition, Ban fails to disclose “wherein the flash abstraction logic
10 invokes the flash media logic to perform memory operations that are potentially
11 performed in different ways depending on the type of the flash memory media”.
12 Rather, under Ban the controllers are bound to a particular flash chip and thus are
13 limited to performing memory operations specific to that flash chip only.

14 In rejecting claim 1, the Office relies on Fig.1, and Col. 2, lines 36-38 as
15 disclosing a flash memory driver (a controller in Ban) comprising flash abstraction
16 logic invokable by a file system to manage flash memory operations without
17 regard to the type of the one or more flash memory media. (*Office Action*, Page 3).
18 Applicant respectfully disagrees. As noted above, controllers, as disclosed in Ban,
19 are flash chip specific, and cannot be used with more than one type of flash chip.
20 Thus any controller disclosed in Ban would only be able to manage flash
21 operations with regard to one specific type of chip, and not “without regard to the
22 type of the one or more flash memory media” as recited in claim 1.

23 The Office also relies on claim 2; the Abstract; Col. 2, lines 36-38; and Col.
24 4, lines 33-39 and 61-65 of Ban as disclosing flash media logic configured to
25 interact with different types of flash memory media (flash chips); wherein the flash

1 abstraction logic invokes the flash media logic to perform memory operations that
2 are potentially performed in different ways depending on the type of the flash
3 memory media. (*Office Action*, Page 3).

4 Again, Applicant respectfully disagrees. Since the controllers taught in Ban
5 are flash chip specific, no one controller could interact with different types of flash
6 memory media or perform memory operations that are potentially performed in
7 different ways depending on the type of flash memory media. Rather, such
8 versatile functionality could only be realized through the utilization of a plurality
9 of different controllers, with each controller corresponding to a different type of
10 flash memory media.

11 Accordingly, since Ban does not teach all of the elements of claim 1, the
12 §102(b) anticipation rejection of claim 1 based on Ban is not supported. Applicant
13 therefore respectfully requests that the §102(b) rejection of claim 1 be withdrawn.

14 **Dependent claims 5-7** are allowable at the least by virtue of their
15 dependency on base claim 1, as well as for the additional elements they contain.
16 Applicant respectfully requests that the §102(b) rejection of claims 5-7 be
17 withdrawn.

18
19 **Independent claim 9** recites:

20
21 A flash driver, comprising:
22 flash abstraction logic, interposed between a file
23 system and a flash memory medium, configured to:
24 (a) map a logical sector status from the file system to a
25 physical sector status of the flash memory medium; and
(b) maintain memory requirements associated with
operating the flash memory medium.

1 Ban fails to disclose the flash driver of claim 9. In particular, under Ban
2 during a read write operation the CPU specifies the flash address at which a
3 read/write operation shall take place. (Ban, Col. 3, lines 43-45). Thus, under Ban
4 the CPU, rather than the flash driver, must coordinate and organize all mappings
5 between a computer's file system (using, for example, logical sector addressing)
6 and the flash array (using, for example, physical sector addressing). This is the
7 opposite of a "flash driver, comprising: flash abstraction logic, interposed between
8 a file system and a flash memory medium, configured to: (a) map a logical sector
9 status from the file system to a physical sector status of the flash memory medium;
10 and (b) maintain memory requirements associated with operating the flash memory
11 medium".

12 In rejecting claim 9, the Office relies on the same bases as used in the
13 rejection of claim 1, namely Fig.1; claim 2; the Abstract; Col. 2, lines 36-48; and
14 Col. 4, lines 33-39 and 61-65 of Ban. (*Office Action*, Page 5). However, the
15 elements of claim 9 are neither disclosed in the cited passages nor anywhere else
16 within Ban. As discussed more fully above, the standardized commands received
17 via a command register are read, write, erase and identify. However, the CPU, and
18 not the flash driver, provides the flash address at which a read or write operation is
19 to take place.

20 Accordingly, since Ban fails to show each and every element of claim 9 the
21 §102(b) rejection of claim 9 based on Ban is not supported. Applicant therefore
22 respectfully requests that the §102(b) rejection of claim 9 be withdrawn.

23 **Dependent claims 10-11** are allowable due to their dependence from an
24 allowable base claim. These claims are also allowable for their own recited
25 features that, in combination with those recited in claim 9, are neither disclosed

1 nor suggested in Ban. Applicant therefore respectfully requests that the §102(b)
2 rejection of claims 10 and 11 be withdrawn.

3
4 **Independent claim 16 recites:**

5 A flash driver, comprising:
6 user programmable flash medium logic, configured to
7 read, write and erase data to and from a flash memory medium; and
8 flash abstraction logic, interposed between a file
9 system and flash memory medium to maintain universal
10 requirements for the operation of the flash memory medium.

11 Ban fails to disclose the flash driver of claim 16. Rather, as discussed in
12 more detail above, Ban teaches the use of flash chip specific controllers, such that
13 for each flash chip used, a separate controller compatible with the flash chip must
14 be employed on the flash chip. Thus, unlike claim 16, where programmable flash
15 medium logic may be programmed by a user to interact with a flash memory
16 medium, under Ban a new controller must be chosen to interact with each new
17 flash chip.

18 In rejecting claim 16, the Office relies on the same bases as used in the
19 rejection of claims 1 and 7 -- namely Fig.1; claim 2; the Abstract; Col. 2, lines 36-
20 48; Col. 4, lines 33-39 and 61-65; and Col. 3, line 49 – Col. 4, line 13 of Ban.
21 (*Office Action*, Page 5). However, as noted above, Ban fails to disclose or show
22 both “user programmable flash medium logic, configured to read, write and erase
23 data to and from a flash memory medium”.

24 Accordingly, Applicant respectfully requests that the §102(b) rejection of
25 claim 16 be withdrawn.

1 **Dependent claims 17 and 22** are allowable at the least by virtue of their
2 dependency on base claim 16, as well as for the additional elements they contain.
3 Applicant respectfully requests that the §102(b) rejection of claims 17 and 22 be
4 withdrawn.

5 **Independent claim 23** recites:

6 A processing device that uses a flash memory medium for
7 storage of data, comprising:

8 a file system, configured to control data storage for the
9 processing device;

10 flash media logic, configured to perform physical
11 sector operations to a flash memory medium based on physical sector
12 commands, wherein the flash medium logic comprises a set of
13 programmable entry points that can be implemented by a user to
14 interface with the type of flash memory medium selected; and

15 flash abstraction logic, configured to maintain flash
16 memory requirements that are necessary to operate the flash memory
17 medium.

18 Ban fails to disclose the processing device of claim 23. As noted above,
19 under Ban a separate compatible controller must also be used for each flash chip
20 employed. This is different than a flash media logic including “a set of
21 programmable entry points that can be implemented by a user to interface with the
22 type of flash memory medium selected” disclosed in claim 23. The difference lies
23 in the fact that the flash media logic of claim 23 may easily be used with multiple,
24 different flash media. In contrast, under Ban, multiple controllers would be
25 needed to interface with multiple, different flash chips.

26 In rejecting claim 23, the Office relies on Ban, Col. 2, lines 17-23; Col. 3,
27 lines 15-24; Col. 2, lines 36-48 and Fig 1. (*Office Action*, Page 4). Applicant
28 respectfully disagrees. As noted above, Ban discloses using different controllers
29 for different flash chips, wherein each controller is located on the flash chip it

1 serves. Thus, a flash medium logic that can interface with several types of flash
2 memory media makes no sense under Ban.

3 In addition, no mention is given in Ban regarding a set of *programmable*
4 *entry points* on the flash medium logic that can be implemented by a user to
5 interface with the type of flash memory medium selected. In rejecting this portion
6 of claim 23, the Office relies on Col. 3, lines 15-24. (*Office Action*, Page 4).
7 Applicant respectfully disagrees, as this passage has nothing to do with
8 programmable entry points, and instead discloses a command register on a
9 controller into which a command from the CPU is written before the command is
10 translated by the controller to a command particular to the flash unit to which the
11 controller is attached. Thus, “*programmable entry points* that can be implemented
12 by a user to interface with the type of flash memory medium selected” as recited in
13 claim 23 is not disclosed in Ban.

14 Accordingly, Applicant respectfully requests that the §102(b) rejection of
15 claim 23 be withdrawn.

16 **Dependent claims 24-25, 29 and 31-32** are allowable at the least by virtue
17 of their dependency on base claim 23, as well as for the additional elements they
18 contain. Applicant respectfully requests that the §102(b) rejection of claims 24-25,
19 29 and 31-32 be withdrawn.

20 **Independent claim 33** recites:

21
22 In a processing device that uses a flash memory medium for
23 storage of data, a method for driving the flash memory medium,
24 comprising:

25 managing rules associated with operating the flash memory
medium in a flash abstraction logic; and

1 issuing physical sector commands directly to the flash
2 memory medium from a flash medium logic.

3 Ban fails to disclose the processing device of claim 33. In particular, under
4 Ban during a read write operation the CPU specifies the flash address at which a
5 read/write operation shall take place. (Ban, Col. 3, lines 43-45). Thus, the CPU,
6 rather than the flash driver, must coordinate and organize all mappings between a
7 computer's file system (using, for example, logical sector addressing) and the flash
8 array (using, for example, physical sector addressing). Therefore Ban does not
9 disclose "issuing physical sector commands directly to the flash memory medium
10 from a flash medium logic".

11 The Office argues that the claimed method for driving the flash memory
12 medium is shown in Fig.1; claim 2; the Abstract; Col. 2, lines 36-48; claim 7; Col.
13 3, lines 19-24 of Ban; Col. 4, lines 33-29 and 61-65; and Col. 3, line 49-Col. 4,
14 line 13 of Ban. (*Office Action*, Page 5). Applicant respectfully disagrees. As
15 noted above, under Ban the CPU, and not the flash driver, provides the flash
16 address at which a read or write operation is to take place. Thus, as best as
17 Applicant understands Ban, the CPU, rather than the flash driver, must coordinate
18 and organize all mappings between a computer's file system (using, for example,
19 logical sector addressing) and the flash array (using, for example, physical sector
20 addressing). Accordingly, Applicant respectfully requests that the §102(b)
21 rejection of claim 33 be withdrawn.

22 **Dependent claims 37 and 39-41** are allowable at the least by virtue of their
23 dependency on base claim 33, as well as for the additional elements they contain.
24
25

1 Applicant respectfully requests that the §102(b) rejection of claims 37 and 39-41
2 be withdrawn.

3
4 **Independent claim 42** recites:

5 A computer-readable medium for a flash driver, comprising
6 computer-executable instructions that, when executed, direct the
7 flash driver to provide an interface between a file system, selected
8 from one of a plurality of different file systems, and a flash memory
9 medium, selected from one of a plurality of different flash memory
10 media.

11 Ban fails to disclose the computer readable medium for a flash driver of
12 claim 42. As discussed above, under Ban the responsibility for conforming to the
13 particular requirements of a flash chip is given to a controller installed on an
14 individual flash chip. Thus the controllers used under Ban are flash chip specific,
15 and are limited to providing an interface for only one specific chip. Therefore, a
16 single controller under Ban cannot provide an interface between “one of a plurality
17 of different flash memory media” as disclosed in claim 42. Rather, under Ban, in
18 order to provide an interface with more than one different flash chip, an equivalent
19 number of controllers would be needed, with one controller being located on each
20 flash chip. Therefore, Ban does not disclose “comprising computer-executable
21 instructions that, when executed, direct the flash driver to provide an interface
22 between a file system, selected from one of a plurality of different file systems, and
23 a flash memory medium, selected from one of a plurality of different flash memory
24 media”.

25 In rejecting claim 42, the Office relies on the same bases as were used to
reject claim 1 -- Fig. 1; claim 2; the Abstract; and Col. 2, lines 36-48 of Ban.

1 (Office Action, Page 6). Applicant respectfully disagrees. As discussed in more
2 detail above, these passages disclose placing separate controllers on each flash
3 chip in an array in order to interface with a CPU. Thus no one controller can
4 interface with “a flash memory medium, selected from one of a plurality of
5 different flash memory media” as recited in claim 42. Accordingly, Applicant
6 respectfully requests that the §102(b) rejection of claim 42 be withdrawn.

7
8 **Independent claim 43** recites:

9 A computer-readable medium for a flash driver, comprising
10 computer-executable instructions that, when executed, direct the
flash driver to:

11 provide an interface between a file system, selected
12 from one of a plurality of different files systems, and a flash memory
medium, selected from one of a plurality of different flash memory
13 media; and

14 manage a set of characteristics that are common to the
plurality of different flash memory media at a flash abstraction logic.

15
16 Ban fails to disclose the computer-readable medium for a flash driver of
17 claim 43. Similar to claim 42 above, under Ban, the responsibility for conforming
18 to the particular requirements of a flash chip is given to a controller installed on
19 the flash chip itself. Thus the controllers used under Ban are flash chip specific,
20 and can provide an interface for only one chip. Therefore, a single controller
21 under Ban cannot provide an interface between “one of a plurality of different
22 flash memory media” as disclosed in claim 43. Rather, under Ban, in order to
23 provide an interface with more than one different flash chip, an equivalent number
24 of controllers would be needed, with one controller being located on each flash
25 chip. Therefore Ban does not disclose “provide an interface between a file system,

1 selected from one of a plurality of different files systems, and a flash memory
2 medium, selected from one of a plurality of different flash memory media” as
3 recited in claim 43.

4 Moreover, since the controllers disclosed in Ban are flash chip specific, it
5 would take a plurality of controllers to manage characteristics common to a
6 plurality of flash chips. Therefore, Ban does not disclose a flash driver which can
7 “manage a set of characteristics that are common to the plurality of different flash
8 memory media at a flash abstraction logic” as is recited in claim 43. Rather, under
9 Ban a plurality of controllers having flash abstraction logic would be required to
10 fulfill this function.

11 The Office argues that the same passages cited with regard to claim 42
12 above disclose the claimed computer-readable medium claimed in claim 43.
13 (*Office Action*, Page 5). Applicant respectfully disagrees. As noted above, these
14 passages disclose placing separate controllers on each flash chip in an array in
15 order to interface with a CPU. Thus, under Ban no one controller can interface
16 with a flash memory medium, selected from one of a plurality of different flash
17 memory media, and no one controller can manage a set of characteristics common
18 to a plurality of different flash memory media at a flash abstraction logic.
19 Accordingly, Applicant respectfully requests that the §102(b) rejection of claim 43
20 be withdrawn.

21
22 **Independent claim 44 recites:**

23 A computer-readable medium for a flash driver, comprising
24 computer-executable instructions that, when executed, direct the
25 flash driver to:

1 provide an interface between a file system, selected
2 from one of a plurality of different files systems, and a flash memory
medium, selected from one of a plurality of different flash memory
media;

3 manage a set of characteristics that are common to the
4 plurality of different flash memory media at a flash abstraction logic;
and

5 provide programmable entry points that can be
6 optionally selected by a user to interface with the type of flash
memory medium selected.

7
8 Ban fails to disclose the computer-readable medium for a flash driver of
9 claim 44. As discussed above, under Ban the responsibility for interfacing with
10 the particular requirements of a flash chip is given to a controller installed on an
11 individual flash chip. Thus the controllers used under Ban are flash chip specific,
12 and can provide an interface for only one chip. Therefore, a single controller
13 under Ban cannot provide an interface between “a file system, selected from one of
14 a plurality of different files systems, and a flash memory medium, selected from
15 one of a plurality of different flash memory media”. Moreover, it also follows that
16 a controller under Ban cannot “manage a set of characteristics that are common to
17 the plurality of different flash memory media at a flash abstraction logic”. To
18 achieve this sort of functionality, Ban would require a plurality of controllers rather
19 than the single flash driver recited in claim 44.

20 In addition, since a controller under Ban is configured to interface with a
21 particular flash chip -- and is even located on a particular flash chip -- a controller
22 could not be used to “provide programmable entry points that can be optionally
23 selected by a user to interface with the type of flash memory medium selected”.
24 This would imply that a controller disclosed in Ban could work with several
25 different flash chips, which it can't. Moreover, there is no disclosure in Ban which

1 mentions “programmable entry points that can be optionally selected by a user”.
2 Rather, under Ban the user is limited to the use of a specific controller adapted to
3 operate with a specific flash chip. No other choice is possible.

4 The Office argues that the claimed computer-readable medium is shown in
5 Col. 3, lines 49- Col. 4, line 13. (*Office Action*, Page 5). Applicant respectfully
6 disagrees. Ban discloses only controllers that are configured for one specific type
7 of flash chip. Thus the versatility recited in claim 44 above would be impossible
8 under Ban. Moreover, nowhere in Ban are “programmable entry points that can be
9 optionally selected by a user to interface with the type of flash memory medium
10 selected” disclosed. Accordingly, Applicant respectfully requests that the §102(b)
11 rejection of claim 44 be withdrawn.

12 13 **35 U.S.C. §103(a)**

14 The remaining claims are rejected under a set of §103 rejections, all of which
15 rely on Ban as the primary reference. Moreover, all of these claims depend from
16 base claims addressed above.

17 18 **Ban + Bruce**

19 Claims 2, 12, 20, 27 and 35 are rejected under 35 U.S.C. §103(a) as being
20 unpatentable over Ban in view of Bruce. Applicant respectfully traverses the
21 rejection.

22 Claims 2, 12, 20, 27 and 35 depend from respective independent claims 1,
23 9, 16, 23, and 33. As such, they include the features recited in those base claims.
24 The combination of Ban and Bruce fails to teach or suggest the features of these
25 base claims from which the cited claims depend. Ban is primarily cited as teaching

1 the base features, and Bruce is cited as teaching the use of a unified remapping and
2 wear leveling table to overcome the disadvantages of the larger granularity of
3 block remapping.

4 With respect to **dependent claim 2**, neither reference discloses, “flash
5 abstraction logic that is invokable by the file system to manage flash memory
6 operations without regard to the type of the one or more flash memory media” as
7 recited in claim 1 from which claim 2 depends. Ban specifically teaches giving the
8 responsibility for conforming to the particular requirements of a flash chip to a
9 controller installed on an individual flash chip. Thus the controllers used under
10 Ban are flash chip specific, and cannot be used with other types of flash chips.
11 Therefore, each time a new flash chip is used, a new controller that is compatible
12 with the new flash chip must be located on the flash chip.

13 In addition, neither reference discloses, teaches or suggests “flash media
14 logic configured to interact with different types of the flash memory media” or
15 “wherein the flash abstraction logic invokes the flash media logic to perform
16 memory operations that are potentially performed in different ways depending on
17 the type of the flash memory media”. Instead, Ban teaches that the controllers are
18 bound to a particular flash chip and thus are limited to performing memory
19 operations specific to that flash chip. Thus interacting with different types of flash
20 memory media would require several controllers rather than the single flash
21 memory driver recited in claim 1 from which claim 2 depends.

22 Bruce offers no missing teaching. Accordingly, the combination of Ban
23 and Bruce fails to teach or suggest the device of claim 2. Applicant respectfully
24 requests that the §103 rejection of claim 2 be withdrawn.
25

1 With respect to **dependant claim 12**, neither reference discloses “flash
2 abstraction logic, interposed between a file system and a flash memory medium,
3 configured to: (a) map a logical sector status from the file system to a physical
4 sector status of the flash memory medium” as recited by claim 9 from which claim
5 12 depends. Rather Ban teaches away from this by disclosing that during a read
6 write operation the CPU specifies the flash address at which a read/write operation
7 shall take place. Thus, under Ban the CPU, rather than the flash driver,
8 coordinates and organizes all mappings between a computer’s file system (using,
9 for example, logical sector addressing) and the flash array (using, for example,
10 physical sector addressing).

11 Again, Bruce offers no missing teaching. Accordingly, the combination of
12 Ban and Bruce fails to teach or suggest the device of claim 12. Applicant
13 respectfully requests that the §103 rejection of claim 12 be withdrawn.

14 With respect to **dependant claim 20**, for the reasons just given, neither
15 reference teaches or suggests “user programmable flash medium logic, configured
16 to read, write and erase data to and from a flash memory medium”. Accordingly,
17 the combination of Ban and Bruce fails to teach or suggest the device of claim 20.
18 Applicant respectfully requests that the §103 rejection of claim 20 be withdrawn.

19 With respect to **dependant claim 27**, neither reference teaches or suggests
20 “a set of programmable entry points that can be implemented by a user to interface
21 with the type of flash memory medium selected” disclosed in claim 23 from which
22 claim 27 depends. Ban teaches that a separate compatible controller must be used
23 for each flash chip employed. This teaches away from the processing device of
24 claim 27 which may be used with multiple, different flash chips. In contrast, under
25 Ban, multiple controllers would be needed to interface with multiple flash chips.

1 Again, Bruce offers no relevant teaching. Applicant respectfully requests
2 that the §103 rejection of claim 27 be withdrawn.

3 With respect to **dependant claim 35**, neither reference discloses, teaches or
4 suggests “issuing physical sector commands directly to the flash memory medium
5 from a flash medium logic” as recited in claim 33 from which claim 35 depends.
6 Ban teaches that during a read write operation the CPU specifies the flash address
7 at which a read/write operation shall take place. Thus, Ban teaches away from
8 claim 33 and claim 35, which depends from claim 33, by specifying that the CPU,
9 rather than the flash driver, must coordinate and organize all mappings between a
10 computer’s file system (using, for example, logical sector addressing) and the flash
11 array (using, for example, physical sector addressing).

12 Again, Bruce offers no relevant teaching. Applicant respectfully requests
13 that the §103 rejection of claim 35 be withdrawn.

14
15 **Ban + Martwick**

16 Claims 3-4, 13-14, 19, 21, 26, 28, 34, and 36 are rejected under 35 U.S.C.
17 §103(a) as being unpatentable over Ban in view of Martwick. Applicant
18 respectfully traverses the rejection.

19 Claims 3-4, 13-14, 19, 21, 26, 28, 34, and 36 depend from respective
20 independent claims 1, 9, 16, 23, and 33. As such, they include the features recited
21 in those base claims. The combination of Ban and Bruce fails to teach or suggest
22 the features of the base claims from which the cited claims depend. Ban is
23 primarily cited as teaching the base features, and Martwick is cited as teaching a
24 method for updating flash blocks so that data integrity gets maintained and data
25 can be recovered upon a power failure.

1 **Dependent claims 3 and 4** depend from claim 1, and hence include the
2 features therein. Neither Ban nor Martwick disclose, “flash abstraction logic that
3 is invokable by the file system to manage flash memory operations without regard
4 to the type of the one or more flash memory media” as recited in claim 1. As noted
5 above, Ban specifically teaches giving the responsibility for conforming to the
6 particular requirements of a flash chip to a controller installed on an individual
7 flash chip. Thus the controllers used under Ban are flash chip specific, and cannot
8 be used with other types of flash chips. Therefore, each time a new flash chip is
9 used, a new controller that is compatible with the new flash chip must be located
10 on the flash chip.

11 In addition, neither reference discloses, teaches or suggests “flash media
12 logic configured to interact with different types of the flash memory media” or
13 “wherein the flash abstraction logic invokes the flash media logic to perform
14 memory operations that are potentially performed in different ways depending on
15 the type of the flash memory media”. Ban teaches that the controllers are bound to
16 a particular flash chip and thus are limited to performing memory operations
17 specific to that flash chip. Thus interacting with different types of flash memory
18 media would require several controllers rather than the single flash memory driver
19 recited in claim 1 from which claims 3 and 4 depend.

20 Martwick fails to add any relevant teaching with respect to these features.
21 Accordingly, the combination of Ban and Martwick fails to teach or suggest the
22 device of claims 3 and 4. Applicant respectfully requests that the §103 rejection of
23 claims 3 and 4 be withdrawn.

24 Similarly **dependant claims 13 and 14** depend from base claim 9 and thus
25 include the features therein.

1 Ban fails to teach or suggest "flash abstraction logic, interposed between a
2 file system and a flash memory medium, configured to: (a) map a logical sector
3 status from the file system to a physical sector status of the flash memory medium"
4 as recited by claim 9. As previously discussed, Ban teaches away from this by
5 disclosing that during a read write operation the CPU specifies the flash address at
6 which a read/write operation shall take place. Thus, under Ban the CPU, rather
7 than the flash driver, coordinates and organizes all mappings between a computer's
8 file system (using, for example, logical sector addressing) and the flash array
9 (using, for example, physical sector addressing).

10 Again, Martwick offers no missing teaching. Accordingly, the combination
11 of Ban and Martwick fails to teach or suggest the device of claims 13 and 14.
12 Applicant respectfully requests that the §103 rejection of claims 13 and 14 be
13 withdrawn.

14 **Dependant claims 19 and 21** depend from base claim 16 and hence include
15 the features therein. For the reasons just given, neither reference teaches or
16 suggests "user programmable flash medium logic, configured to read, write and
17 erase data to and from a flash memory medium". Accordingly, the combination of
18 Ban and Martwick fails to teach or suggest the devices of claims 19 and 21.
19 Applicant respectfully requests that the §103 rejection of claims 19 and 21 be
20 withdrawn.

21 **Dependant claims 26 and 28** depends from base claim 23 and hence
22 include the features therein. Neither reference teaches or suggests "a set of
23 programmable entry points that can be implemented by a user to interface with the
24 type of flash memory medium selected" disclosed in claim 23 from which claims
25 26 and 28 depend. Ban teaches that a separate compatible controller must be used

1 for each flash chip employed. This teaches away from the processing device of
2 claims 26 and 28, which may be used with multiple, different flash chips. In
3 contrast, under Ban multiple controllers would be needed to interface with multiple
4 flash chips.

5 Again, Martwick offers no relevant teaching. Applicant respectfully
6 requests that the §103 rejection of claims 26 and 28 be withdrawn.

7 Similarly, **dependant claims 34 and 36** depend from base claim 33 and
8 hence include the features therein. Neither reference discloses, teaches or suggests
9 “issuing physical sector commands directly to the flash memory medium from a
10 flash medium logic” as recited in claim 33 from which claims 33 and 36 depend.
11 Ban teaches that during a read write operation the CPU specifies the flash address
12 at which a read/write operation shall take place. Thus, Ban teaches away from
13 claims 33, 34 and 36 by specifying that the CPU, rather than the flash driver, must
14 coordinate and organize all mappings between a computer’s file system (using, for
15 example, logical sector addressing) and the flash array (using, for example,
16 physical sector addressing).

17 Again, Martwick offers no relevant teaching. Applicant respectfully
18 requests that the §103 rejection of claims 34 and 36 be withdrawn.

1 **CONCLUSION**

2 All pending claims 1-44 are in condition for allowance. Applicant
3 respectfully requests reconsideration and prompt issuance of the subject
4 application. If any issues remain that prevent issuance of this application, the
5 Examiner is urged to contact the undersigned attorney before issuing a subsequent
6 Action.

7
8 Respectfully Submitted,

9
10 Dated: Oct 20, 2005
